

Pastured pigs are vitamin enriched naturally

Pigs raised on pasture have 300 percent more vitamin E and 74 percent more selenium (a vital antioxidant) in their milk than pigs raised in confinement, according to Don C. Mahan Professor of Animal Sciences at Ohio State University. This bounty of nutrients promotes healthier litters, shorter farrowing times, and good milk let down. The pigs' meat is enriched with vitamins as well. Fortifying the pigs' diet with synthetic vitamins, the standard practice in confinement operations, does not achieve the same results because the artificial vitamins are more poorly absorbed.
